

Lab 4: VibeCoding - Chat & Prompt History

Student SRN: PES1UG24AM347 | Target Aim Trainer (Pygame)

Summary of Prompting & AI Tasks:

1. Analyzed Lab handout and identified starter bugs and 4 required tasks.
 2. Automated before/after 10-second screen recordings (before_changes.avi & after_changes.avi).
 3. Task 1: Fixed Target.contains_point() to match visual_radius() instead of base_radius.
 4. Task 2: Replaced console print with interactive in-game Game Over GUI screen.
 5. Task 3: Added difficulty selector menu and replay options (Easy, Medium, Hard).
 6. Task 4: Created sounds.py for procedural sound synthesis for hit, miss, and timeout.
 7. Created separate commits per task and prepared push to student GitHub repository.

[AI Assistant (Antigravity)]:

Let me first read the PDF requirements and examine the existing codebase.

[AI Assistant (Antigravity)]:

Let me also look at the existing project structure while that installs:

[AI Assistant (Antigravity)]:

Good, PyMuPDF installed. Now let me extract the PDF and read the existing code:

[AI Assistant (Antigravity)]:

Now let me read the README file and the existing code:

[AI Assistant (Antigravity)]:

Now I have a complete understanding of the project. Let me check the git status and then p

[AI Assistant (Antigravity)]:

Now I have a clear picture. The current code already has **all 4 tasks implemented** (the

1. First get the **original broken code** to record the "before" video
2. Then record the **fixed code** for the "after" video

Let me first stash the current changes, record the broken "before" state, then restore and

Let me first revert to the original broken code to record the "before" video:

[AI Assistant (Antigravity)]:

Good, now let me verify the original broken code is in place:

[AI Assistant (Antigravity)]:

Good, the original broken code is now in place. Let me now record the **"Before" video** s

[AI Assistant (Antigravity)]:

Now let me record the **before** video by launching the game and interacting with it:

[AI Assistant (Antigravity)]:

Now let me record the broken game behavior using the browser recording tool (since the gam

Let me take a different approach · I'll create a screen recording script:

[AI Assistant (Antigravity)]:

The browser recorder can't capture native pygame windows. Let me kill the running game and

[AI Assistant (Antigravity)]:

I can't programmatically record the native pygame window via browser. Let me create automa

[AI Assistant (Antigravity)]:

While that installs, let me create the recording script for the "before" state:

[AI Assistant (Antigravity)]:

OpenCV is installed. Now let me record the **BEFORE** video (original broken code):

[AI Assistant (Antigravity)]:

Minor encoding issue with the arrow character. Let me fix it and re-run:

[AI Assistant (Antigravity)]:

The "before" video recorded successfully (654 frames). Now let me restore the fixed code a

[AI Assistant (Antigravity)]:

Good, the fixed code is back. Now record the **AFTER** video:

[AI Assistant (Antigravity)]:

Both videos recorded successfully! Let me verify they exist and check the git remote:

[AI Assistant (Antigravity)]:

Hmm, the before file exists but the after isn't showing. Let me check:

[AI Assistant (Antigravity)]:

Both video files exist. Now let me clean up the temporary files and prepare the step-by-st

[AI Assistant (Antigravity)]:

Now let me check the current git status to understand exactly what needs to be committed:

[AI Assistant (Antigravity)]:

Now let me check the current git remote configuration:

[AI Assistant (Antigravity)]:

Good. The current remote `origin` points to the original repo (SETAPESU26). The user needs

[AI Assistant (Antigravity)]:

Now let me create the comprehensive step-by-step instructions artifact:
